

SCALPBOT - Scalp Deck

Guide to every window of the live scalping dashboard for **BTCUSDT**, **XAUUSD**, **BNBUSDT** and **SOLUSD**: liquidation map, order book heatmap, pressure meter, big trades, TradingView window and the footprint / price-action panel — what each one measures and how to read it.

Version **30 September 2026** · English

Execution platform: **Exness**

Educational tool · **not investment advice**

Contents

1	What the dashboard is	9	Big trades
2	Layout · desktop split view & phone	10	TradingView window · auto tools
3	Header · market, timeframe, alert	11	Footprint · volume profile chart
4	Floating widgets · price, music, hide toggle	12	Entry timing
5	Market activity status	13	Price action · open position
6	Liquidation map & liquidation heatmaps	14	Multi-market notes
7	Pressure meter	15	Daily workflow, glossary & risk notice
8	Order book heatmap		

QUICK START

1. Open liemyo.github.io/btcusdt and pick the **Market** and **Timeframe** in the header.
2. Read the context: market activity, liquidation clusters (magnets), order book walls, the pressure meter and big trades.
3. Look at the **Footprint** panel: it shows a price-action entry with stop and targets, and **Entry timing** tells you when conditions are good.
4. Execute manually on Exness (button **EXNESS** ↗) and always place the stop loss shown.

1 What the dashboard is

The Scalp Deck reads live **Binance spot** data (candles, every trade, the full order book) and **Gate.io futures** data (liquidations, open interest, funding). Other exchanges (Bybit, OKX, Coinbase) are added automatically when your network can reach them.

The page is a set of **instruments**: they show where liquidity, liquidations and aggressive orders are, and they propose entries with a stop loss and targets. It never trades for you.

Validated vs. chart aids

SOURCE	STATUS	HOW TO USE IT
Sniper engine (runs in the background)	backtested 400 days, parameters confirmed out of sample	Shown in the Footprint panel as Validated Sniper when a setup is live — the strongest confirmation.
Footprint price action	not backtested	Chart rules with structural stops. Use with the timing score and context; keep risk small.
TradingView auto tools	not backtested	Levels and structure (Fibonacci, breakouts, N wave, RSI swings).
Meter, heatmaps, big trades, liquidations	measurements	Context and short-term pressure — not signals on their own.

IMPORTANT
No indicator wins every trade. Expect losing streaks, never move a stop further away and risk only 0.5–1 % of capital per trade.

2 Layout · desktop split view & phone

Desktop split view (1920 × 1080): everything on one screen, no scrolling.

On a computer screen of at least 1280 × 680 pixels the dashboard fills the window like a trading terminal:

AREA	WINDOW
Top	Header, then the one-line market activity status
Top-left	Liquidation map (3 days) + liquidation heatmaps 1 month / 1 week / 12 hours
Top-right	TradingView window with the auto tools
Bottom-left	Pressure meter · order book heatmap · big trades
Bottom-right	Footprint: entry timing · footprint chart · price action

Every chart stretches with the window. On smaller laptops (1280–1599 px wide) side columns become narrower and the hourly volume profile of the status strip is hidden.

Phones and tablets

Windows are stacked and the page scrolls: status, liquidation map and heatmaps, pressure meter, order book heatmap, big trades, TradingView window, footprint. The price widget and the music button stay small in the corners.

The  button on the order book heatmap and on the TradingView window opens that window full-screen (**Esc** or **X** closes it).

ALERT: OFF

EXNESS ↗

07:57:12

UTC · 126 ms

CONTROL	WHAT IT DOES
Market	BTCUSDT · XAUUSDT (gold) · BNBUSDT · SOLUSDT. Every window reloads for the chosen market.
Timeframe	Applied to every window that has a timeframe: the TradingView window (1M · 5M · 15M · 1H · 4H · 1D) and the Footprint (1M and 5M; for 15M and higher the footprint keeps its own setting). Windows with fixed periods — liquidation map, order book heatmap, big trades — are not affected.
ALERT: ON / OFF	Sound alerts for all windows: a new footprint price-action setup (high tone = BUY, low tone = SELL), the pressure meter entering STRONG BUY / STRONG SELL, and a big trade of at least 5× the chosen minimum. The choice is remembered.
USER GUIDE · PDF	Downloads this guide.
EXNESS ↗	Opens Exness web trading to execute manually.
Clock	UTC time and data latency (ms); WIB (Jakarta) time is shown in the strap line.

4 Floating widgets · price, music, hide toggle

Live price (top-left)

Amber widget with the current price of the market chosen in the header, the 24-hour change in % and points, and a green dot when the live stream is connected. On every tick the border and the price flash **green** (up) or **red** (down).

Music and the "·" toggle (bottom-right)

MUSIC plays or pauses background music. The tiny · button right of it hides or shows all floating widgets (price and music) — useful for a clean screen or screenshots. Your choice is remembered.

Floating widgets lie on top of the page and never move or resize the windows below them.

5 Market activity status

Compares the last 60 minutes of volume and number of trades with the 7-day median for the same hour.

- **HIGH / NORMAL** — trading recommended: tighter spread and slippage, levels hold more reliably.
- **LOW / VERY LOW** — thin market: signals fail more often; trade smaller or wait for the busy hours shown.
- **Hourly volume profile** — average volume per hour of the day in WIB; green bars are the usual busy hours, white = now.

6 Liquidation map & liquidation heatmaps

- **Liquidation map • 3 days** — estimated liquidation volume per price for 10x, 25x, 50x and 100x leverage. **Cum Long** (red) is the total long liquidations below price, **Cum Short** (green) the total short liquidations above. Big bars near price act as **magnets**: price often runs into them to trigger the stops.
- **Heatmaps 1 month (4H candles) • 1 week (1H) • 12 hours (5M)** — the same estimate through time. A band disappears once price trades through it; brighter = more positions at risk.

HOW TO USE IT

Targets placed just before a big cluster are hit more often; stops placed inside a cluster on the opposite side are hunted more often. The pressure meter and the price-action panel use the nearest clusters automatically.

PRESSURE METER

The gauge features a semi-circular scale divided into three color-coded sections: red on the left labeled 'SELL', grey in the middle labeled 'NEUTRAL', and green on the right labeled 'BUY'. A white needle points from a central yellow dot towards the green section.

NEUTRAL +9

balanced · range 83,038 - 83,528

biggest bid wall ↔ biggest ask wall ($\pm 0.5\%$)

liq ↑ 84,648 \$15.23M · liq ↓ 82,148 \$13.33M

Taker flow 60s 35%		+24
Book $\pm 0.1\%$ 25%		-4
Book $\pm 0.5\%$ 15%		+9
Momentum 60s 15%		+0
Liq magnet pull 10%		+5

Needle = weighted taker flow, order book imbalance, 60 s momentum and liquidation magnet pull (-100 sell ... +100 buy). Short-term pressure only – not a trade signal.

COMPONENT	WEIGHT
Taker flow, last 60 s	35 %
Order book imbalance ± 0.1 %	25 %
Order book imbalance ± 0.5 %	15 %
Momentum 60 s	15 %
Liquidation magnet pull	10 %

Leaning toward is the price the pressure is heading to: the biggest order book wall ($\pm 0.5\%$) or liquidation magnet on the dominant side. When neutral it shows the range between the biggest bid wall and the biggest ask wall.

Short-term pressure only — not a trade signal by itself.

8 Order book heatmap

A live copy of the Binance order book (up to 5000 levels, updated every 100 ms) drawn through time. Each column is a moment, each row a price; the colour shows how much is resting there (dark blue = little, yellow / orange / red = large walls).

ELEMENT	MEANING
Green / red stepped line	Best bid / best ask
Bubbles	Trades (green buy, red sell); size = value; minimum set with BUBBLES
Yellow ring	A liquidation
Labels "x BTC · price"	Top 3 walls per side
Right histogram	Current depth per price (green bids, red asks)
▲ / ▼ LEAN line	Target from the pressure meter

WINDOW sets the time shown (1–20 min), **RANGE** the price span ($\pm 40 \dots \pm 640$ points). Hover to read exact size and time. = full screen. The history starts when the page opens, so the left part fills in over the first minutes.

READING WALLS

A wall that stays while price approaches often holds (bounce); a wall that is pulled just before price arrives ("spoofing") or eaten by aggressive trades usually leads to a breakout through that level.

9 Big trades

Taker volume boxes

Rows 5m · 30m · 4h · 1d: aggressive buy volume (green, left) against aggressive sell volume (red, right) in USD, from Binance spot. The split of the colours shows who is in control over each period.

Big prints tape

Every aggressive trade above the chosen minimum (≥ \$50K / \$100K / \$250K / \$500K) with exchange icon, price, size and time. Fills from the same exchange and side within 150 ms are merged into one print (a sweep). Green = taker buy, red = taker sell; brighter = bigger.

ICON	SOURCE
B	Binance spot
G	Gate futures
Y	Bybit futures
O	OKX swap
C	Coinbase

The footer shows which sources are connected (green dot). Some networks block Bybit, OKX or Coinbase; the tape then uses the sources that work.

10 TradingView window · auto drawing tools

15M with Auto Fibonacci, Auto Breakout Retracement, RSI Swing and Auto TP & SL switched on.

A TradingView-style chart. It loads its own Binance candles for the selected market (up to 1000 bars, updated every 3 seconds) and draws the analysis for you. Drag to scroll, use the mouse wheel to zoom, double-click to go back to the latest candles.

CONTROL	WHAT IT DOES
TF dropdown	Timeframe of this window: 1m · 5m · 15m · 30m · 1h · 4h · D · W. Changing the header timeframe sets it too; you can still pick 30m or W here.
TOOLS dropdown	Switch every auto tool and indicator on or off (the pink number = how many are on) and set the swing sensitivity (Low = major swings, High = minor swings).
RESET · BLANK	Removes every drawing and indicator — plain candles only.
Full-screen icon	Full-screen window; X or Esc closes it.

Your timeframe, tools and sensitivity are remembered in this browser.

10 TradingView window • the tools

Blank chart (after RESET) with the TOOLS dropdown open.

Auto Fibonacci

Finds the latest **major swing** with an ATR zigzag and draws the retracement from the swing start (1) to the swing end (0): 0.236 · 0.382 · 0.5 · 0.618 · 0.786, the 1.618 extension on the far side and two yellow dashed **extension targets** beyond the swing end (1.272 and 1.618). The card shows the leg direction and how deep price has retraced. The swing is replaced automatically when price makes a new extreme.

Auto Breakout Retracement

Looks for the most recent close through a **swing high/low level** (dashed yellow) or through a **trendline** drawn over two falling highs / rising lows (solid yellow) and marks it **BO ▲ / BO ▼**. The blue box is the **38.2–61.8 % retest zone** of the breakout move; the red dotted line is 78.6 %. Status: **EXTENDING** (no pullback yet) → **WAITING RETEST** → **RETEST IN ZONE** → **DEEP RETRACE** (weak) or **FAILED** (closed back beyond the origin).

RSI Swing Indicator

RSI(7) with 70/30 bands in its own pane. A swing high is the highest high from the moment RSI goes above 70 until it goes below 30 (and the other way round). Swings are joined by the blue zigzag and labelled **HH / LH** above and **HL / LL** below; the last one is marked *live* while it can still move.

10 TradingView window · N strategy & TP/SL

Auto N Strategy

The N wave: impulse **A**→**B**, pullback **B**→**C** that holds above A (bull) or below A (bear) and retraces 23.6–95 % of AB. Entry is a **stop order at B**. Targets (Ichimoku wave calculation):

TARGET	FORMULA	MEANING
V	$B + (B - C)$	mirror of the pullback
N	$C + (B - A)$	classic N target (gold line)
E	$B + (B - A)$	extended target
NT	$C + (C - A)$	conservative target

Status: **FORMING** (C still moving) → **WAITING BREAK OF B** → **TRIGGERED** → **N TARGET HIT**, or **INVALID** when C breaks.

Auto Take Profit & Stop Loss

Draws a TradingView-style position box (green = profit, red = risk) with entry, SL and TP1–TP3 and their R multiples. Its card is always the **first card on the left** under the chart, with a thick glowing border (green = **LONG**, red = **SHORT**, yellow = no setup). It uses **only the tools that are switched on**, in this order: N Strategy (confirmed) › Breakout Retest › N Strategy (forming) › Fibonacci. With only TP & SL switched on it falls back to the EMA 50 trend (market entry, SL behind the last swing, TP at 1R/2R/3R).

SOURCE	ENTRY	STOP LOSS	TAKE PROFITS
N Strategy	stop at B	beyond C – 0.25 ATR	V · N · E (sorted by distance)
Breakout retest	limit at 50 % of the zone	beyond 78.6 % – 0.25 ATR	breakout high/low · 1.272 · 1.618
Fibonacci	limit at 0.618	beyond 0.786 – 0.25 ATR	0 · 1.272 · 1.618 extension

CHART AIDS, NOT SIGNALS

These drawings are calculated automatically from the candles and are not backtested like the Sniper setups. Use them to read structure and plan levels; confirm entries with the footprint panel and the validated Sniper signal, and always use a stop loss.

10 TradingView window · weekly example

Weekly (W) with Auto Fibonacci and RSI Swing — the same view as a TradingView weekly chart with the RSI Swing Indicator.

- Higher timeframes (4h · D · W) give the big picture: major Fibonacci zones and the HH/HL or LH/LL structure.
- Lower timeframes (1m–15m) show the breakout, retest and N setups used for scalping levels.
- Use **Low** swing sensitivity for cleaner major swings, **High** for more, smaller swings.

11 Footprint · volume profile chart

The footprint panel: entry timing (left), footprint chart (middle), price-action plan (right). The whole panel border glows green on BUY, red on SELL and yellow while waiting.

Controls in the title bar: **TF** 1m / 3m / 5m (follows the header timeframe for 1M and 5M) and **Candles** 20 / 30 / 45 / 60 shown.

11 Footprint · reading the chart

PART	MEANING
Left strip · order book	Liquidity resting at each price right now: lavender = bids , grey = asks . Long bars are walls.
Candles	Grey = up candle, navy with lavender border = down candle.
Profile inside a candle	For candles recorded live since the page opened: volume traded at each price inside that candle (lavender = taker buy, grey = taker sell); the magenta tick is that candle's point of control.
Right profile · VPVR	Volume per price for all visible candles, buy (lavender) vs sell (grey).
POC	Point of control — price with the most volume (fair value, strong magnet).
VAH / VAL	Value area high / low — the range holding 70 % of the volume. Outside = price is being rejected or accepted at new levels.
CVD candles (bottom)	Cumulative volume delta per candle: rising = aggressive buyers in control, falling = sellers. Price up while CVD falls = weak move (divergence).
Signal lines	White dashed = entry, red = stop loss, green = TP1 (dashed) and TP2.

12 Entry timing

A score from 0 to 100 that tells you **when** conditions are good to act on a setup — never *whether* the setup is right. The inner white ring is the progress of the current candle; the centre shows the time to candle close.

COMPONENT	GOOD WHEN
Candle clock	With a setup: early in a fresh candle. Without: near the close
Activity	Volume pace ≥ normal for this candle
Delta 60 s	Aggressive flow in the trade direction
Book ±0.1 %	Order book imbalance in the trade direction
Distance to entry	Price still close to the planned entry (< ~1 ATR)
Volatility	ATR normal (not dead, not extreme)
Session	EU / US hours (07–21 UTC)

States: **ENTER NOW** (≥ 70 with a setup) · **GET READY** (50–69) · **WAIT** (< 50) · **NO SETUP · READY / WAIT** when there is no setup (timing shown for the current flow direction).

RECENT PRICE-ACTION RESULTS

No filled setups yet in this browser.

Price-action rules are chart aids and are NOT backtested (unlike the Sniper setups). Stops are structural (beyond the sweep / level); TP1 moves the stop to entry. Not investment advice.

Checked on every **closed** candle of the footprint timeframe. When a setup appears the card shows **BUY** or **SELL**, the entry type, **entry**, **stop loss**, **TP1** and **TP2** with their R multiples, the live result in R, the reason and a checklist.

SETUP	RULE
Sweep & reclaim	The candle wicks through VAL / swing low / bid wall (long) or VAH / swing high / ask wall (short) and closes back inside with delta on the reclaim side. Market entry, stop beyond the sweep.
VAH / VAL breakout retest	Price accepted outside the value area, then retests the edge and holds with delta. Limit order at the edge, valid 4 candles.
POC engulfing	Engulfing candle at the point of control with delta in the same direction.

TP1 = the nearest level (POC, value area edge, swing) at least 0.8R away; when TP1 is hit the stop moves to entry. TP2 = the next level or 2.5R. Setups with a stop smaller than 0.2 ATR or larger than 2.5 ATR are ignored; with-trend setups (EMA 50) are preferred.

Below the card: POC and value area, the **Validated Sniper** box (backtested setups from the background engine, with "agrees / opposite to price action") and your recent price-action results in this browser.

NOT BACKTESTED

The price-action rules are chart aids. They are shown with structural stops, but they have not passed a 400-day test like the Sniper setups. Prefer entries where price action, timing (ENTER NOW) and a validated Sniper signal agree.

14 Multi-market notes

- **Gold (XAUUSD)** uses Binance spot **PAXG/USDT** (1 PAXG = 1 troy ounce) as the price; the price widget shows "PAXGUSDT". Gate.io XAU_USDT futures supply liquidations. Exness XAUUSD may differ by a few dollars.
- Point settings (row sizes, distances, costs) scale with each market's volatility; dollar thresholds (big trades, bubbles) scale with market size.
- Prices use the right decimals (SOL 3, others 2).
- The validated Sniper setups were tuned on BTC; on XAU, BNB and SOL they did not pass the test, so the Validated Sniper box stays empty there.

15 Daily workflow, glossary & risk notice

A simple routine

1. Check **market activity**: prefer HIGH / NORMAL hours.
2. Read the context: nearest liquidation clusters, order book walls, pressure meter, big trades and the higher-timeframe structure in the TradingView window.
3. Wait for a **BUY / SELL** in the price-action card, ideally with timing **ENTER NOW** and a validated Sniper signal in the same direction. Turn **ALERT: ON** so you hear new setups.
4. Enter on Exness with the shown entry and **stop loss**; move the stop to entry after TP1.
5. Never move the stop further away. Stop trading after a few losses in a row.

Glossary

ATR	Average True Range — typical candle size; used for stops and targets.
R	Result in units of the initial risk (1R = the stop distance).
POC / VAH / VAL	Point of control, value area high / low of the volume profile.
CVD / delta	Aggressive buys minus aggressive sells (per candle / cumulative).
Taker	The side that crosses the spread (market order).
Wall	Large resting order in the order book.
Liquidation	Forced closing of a leveraged position; clusters attract price.
Sweep	A quick run through a level (stops / liquidations) followed by a return.
Points (pts)	Price units of the selected market (BTC: \$1).

RISK NOTICE

This dashboard is an educational technical-analysis tool. It does not execute trades and is not investment advice. Leveraged CFD and crypto trading carries a high risk of losing money quickly. Past or backtested results do not guarantee future results; data feeds can be delayed or unavailable. Only trade with money you can afford to lose and always use a stop loss.
